20

We claim:

- A method for cycling through addresses of a memory device, comprising: generating for each address a respective bit pattern comprised of a predetermined number of bits; and
- 5 cycling through the respective bit pattern for each of the addresses with a transition of less than the predetermined number of bits for sequencing to each subsequent address.
- 2. The method of claim 1, further comprising:
 cycling through the respective bit pattern for each of the addresses in a gray code
 sequence.
 - 3. The method of claim 2, wherein the memory device is a flash memory device.
 - 4. The method of claim 3, further comprising: eliminating charge gain failure of the flash memory device.
 - 5. The method of claim 2, further comprising: generating a respective binary bit pattern for each of the addresses; converting the respective binary bit pattern to a respective gray code bit pattern for each of the addresses; and

using the respective gray code bit pattern by address decoders for accessing the memory device.

- 6. The method of claim 2, further comprising:
- heating the memory device such that the step of cycling through the respective bit pattern for each of the addresses is performed during a test for HTOL (high temperature operating life) of the memory device.
 - 7. The method of claim 1, further comprising:
- cycling through the respective bit pattern for each of the addresses with a transition of a fixed number of bits for sequencing to each subsequent address.

- 8. The method of claim 1, wherein the memory device is a flash memory device.
- 9. The method of claim 8, further comprising: eliminating charge gain failure of the flash memory device.
- 10. The method of claim 1, further comprising:

heating the memory device such that the step of cycling through the respective bit pattern for each of the addresses is performed during a test for HTOL (high temperature operating life) of the memory device.

- 11. A system for cycling through addresses of a memory device, comprising: an address generator for generating for each address a respective bit pattern comprised of a predetermined number of bits; and
- means for cycling through the respective bit pattern for each of the addresses with a transition of less than the predetermined number of bits for sequencing to each subsequent address.
 - 12. The system of claim 11, further comprising:
- a gray code converter for cycling through the respective bit pattern for each of the addresses in a gray code sequence.
 - 13. The system of claim 12, wherein the memory device is a flash memory device.
- 25 14. The system of claim 13, wherein charge gain failure of the flash memory device is eliminated.
 - 15. The system of claim 12, wherein the address generator generates a respective binary bit pattern for each of the addresses, and wherein the gray code converter converts the respective binary bit pattern to a respective gray code bit pattern for each of the addresses, and wherein the system further comprises:

SE0099

address decoders for decoding the respective gray code bit pattern for accessing the memory device.

- 16. The system of claim 12, further comprising:
- a heater for heating the memory device such that cycling through the respective bit pattern for each of the addresses is performed during a test for HTOL (high temperature operating life) of the memory device.
 - 17. The system of claim 11, further comprising:
- mean for cycling through the respective bit pattern for each of the addresses with a transition of a fixed number of bits for sequencing to each subsequent address.
 - 18. The system of claim 11, wherein the memory device is a flash memory device.
- 15 19. The system of claim 18, wherein charge gain failure of the flash memory device is eliminated.
 - 20. The system of claim 11, further comprising:
- a heater for heating the memory device such that cycling through the respective bit 20 pattern for each of the addresses is performed during a test for HTOL (high temperature operating life) of the memory device.
